Python Programming for Design
Attendance Display System

AIM

To develop a simple application that calculates and displays attendance percentage for the subject Python Programming for Design.

REQUIREMENTS

Python 3 and Tkinter (usually included with Python).

PROCEDURE

1. Import the Tkinter package.

2. Create a window with fields for total classes and classes attended.

3. Calculate attendance percentage using (classes attended / total classes) x 100.

4. Display the percentage and show eligibility based on a 75% threshold.

5. Run the program in Python IDLE.

PROGRAM CODE

```
import tkinter as tk
import matplotlib.pyplot as plt

def calculate():
    total = int(e1.get())
    attended = int(e2.get())

    if total <= 0 or attended < 0 or attended > total:
        result.config(text="Enter valid details")
        return

    percentage = attended / total * 100

    result.config(text="Attendance: " + str(round(percentage, 2)) + "%")

    if percentage >= 75:
        status.config(text="Eligible")
    else:
        status.config(text="Not Eligible")

    plt.bar(["Attended", "Missed"],
            [attended, total - attended])

    plt.title("Python Programming for Design")
    plt.ylabel("Number of Classes")
    plt.show()

window = tk.Tk()
window.title("Attendance")
window.geometry("300x250")

tk.Label(window, text="Python Programming for Design").pack()
```

```
tk.Label(window, text="Total Classes").pack()
e1 = tk.Entry(window)
e1.pack()

tk.Label(window, text="Classes Attended").pack()
e2 = tk.Entry(window)
e2.pack()

tk.Button(window, text="Calculate", command=calculate).pack()

result = tk.Label(window, text="")
result.pack()

status = tk.Label(window, text="")
status.pack()

window.mainloop()
```

OUTPUT

Example input: Total Classes = 40; Classes Attended = 32
Attendance: 80.0%
Eligible

RESULT

The attendance display system was created to calculate attendance percentage and display the eligibility status.
